

Vibe Code Your First MVP

No VS Code. No Anaconda. No setup drama. Just describe it, watch it build, test it, and share it.

Tool	Time	Difficulty	Deliverable
Lovable	45-60 min	Beginner	A live MVP link or screenshot

1. What You Are Building

Everyone starts with the same tiny MVP so nobody gets lost.

Today you will build a small web app called **Campus Task Buddy**. It helps students track assignments, due dates, priorities, notes, and completed tasks. The point is not to build a perfect app.

The point is to experience the AI product-building loop:

2. Before You Begin

Use a free account. Do not enter private data.

1. Go to : <https://lovable.dev/> and create a free account. Easiest with the Google button.
2. Use only classroom-safe information. Do not enter private API keys, student IDs, home addresses, or financial information.
 - If Lovable asks you to upgrade, stop. Stay on the free tier for this lab.
 - If you run out of credits, submit a screenshot of what you built so far.

3. Scenario 1: Build the Exact Same MVP

Do this first. Do not customize yet. We want everyone to get one working version.

COPY/PASTE INTO LOVABLE: Scenario 1 — Campus Task Buddy

Build a simple web app called Campus Task Buddy.

This app is for college students who want a simple way to track assignments without using a complicated project management tool.

Create a clean, friendly, modern interface with these features:

1. A homepage with the title “Campus Task Buddy” and a short subtitle:

“Keep track of your assignments before they sneak up on you.”

2. A task form where I can enter:

- Assignment title
- Course name
- Due date
- Priority: Low, Medium, or High
- Notes

3. A task list that displays each assignment as a card.

4. Each card should show:

- Assignment title
- Course name
- Due date
- Priority
- Notes
- A button to mark the task as done
- A button to delete the task

5. Add three sections:

- Upcoming
- High Priority
- Completed

6. Use a bright but professional student-friendly design.

7. Keep everything simple. Do not require login, payment, external APIs, or complex setup.

8. Make sure the app works in the browser preview.

4. Test Your MVP

A tiny product is not done until someone clicks it.

After Lovable creates the app, use the browser preview. Add these three sample tasks:

COPY/PASTE TEST DATA: Add these sample tasks

Essay draft — English 101 — due Friday — High
Data quiz — AI Foundations — due Monday — Medium
Group meeting notes — Software Engineering — due Wednesday — Low

Test	What to click/type	Pass?
Create task	Add the three sample tasks.	Yes / No
Priority	Confirm High/Medium/Low appears.	Yes / No
Done button	Mark one task as completed.	Yes / No
Delete button	Delete one test task.	Yes / No
Layout	Look at the page on your screen. Is it readable?	Yes / No

COPY/PASTE IF SOMETHING BREAKS: The gentle fix prompt

I tested the app and this part did not work: [describe what happened].
Please fix only that issue without changing the rest of the app design or removing existing features.
After you fix it, briefly tell me what changed.

5. Scenario 2: Make It Your Own

Now you turn the starter MVP into something useful or fun.

Choose one upgrade path. Pick the one that feels useful to you. Paste only one of these prompts into Lovable after Scenario 1 is working.

Student Life

Internship Tracker

Content Board

Project Milestones

OPTION A — COPY/PASTE: Student Life Upgrade

Improve this app for student life.

Add a category field with these choices:

Homework, Exam, Club, Work, Personal.

Add a filter so I can view tasks by category.

Add a small summary area at the top that shows:

- Total tasks
- High priority tasks
- Completed tasks

Keep the design simple and cheerful.

OPTION B — COPY/PASTE: Internship Tracker Upgrade

Transform this app into an Internship Application Tracker.

Replace the assignment fields with:

- Company name
- Role title
- Application deadline
- Status: Interested, Applied, Interviewing, Offer, Rejected
- Notes

Add sections for:

- To Apply
- Applied
- Interviewing
- Completed

Keep the app clean, professional, and useful for a college student looking for internships.

OPTION C — COPY/PASTE: Content Creator Upgrade

Transform this app into a Content Idea Board.

Replace assignments with content ideas.

Each idea should include:

- Title
- Platform: LinkedIn, TikTok, YouTube, Blog, Instagram
- Status: Idea, Drafting, Ready, Posted
- Notes

Add a simple board-style layout so I can see ideas by status.

Make the design modern and creative.

OPTION D — COPY/PASTE: Class Project Milestone Tracker

Transform this app into a Class Project Milestone Tracker.

Each milestone should include:

- Milestone name
- Team member responsible
- Due date
- Status: Not Started, In Progress, Blocked, Done
- Notes

Add a summary area that shows:

- Total milestones
- Blocked milestones
- Completed milestones

Use a clean project-management style design.

6. Publish or Share Your MVP

The win is having something visible at the end.

1. Look for a Share, Publish, or Deploy option in Lovable.
2. If publishing works, copy your app link.
 - If publishing does not work on your account, take a screenshot of the preview.
 - Submit either the link or the screenshot, depending on what your instructor requests.

COPY/PASTE: Final polish prompt

Please improve the visual polish of this app while keeping the same features.
Make the spacing cleaner, the headings clearer, and the buttons easier to understand.
Do not add login, payment, external APIs, or anything complicated.

7. Exit Ticket

Five tiny reflections. No essay.

Question	Your answer
My app link or screenshot is:	
The upgrade path I chose was:	
One thing Lovable did well:	
One thing I had to fix or clarify:	
My MVP helps [type of user] do [important task] so they can [benefit].	

COPY/PASTE: One-sentence MVP description

My MVP helps [type of user] do [important task] so they can [benefit].

Example: My MVP helps students track assignments by priority so they can avoid last-minute panic.

8. What You Just Learned Without Realizing It

Today was the first taste of AI product building.

- A vague idea becomes a product only when you describe the user, task, fields, buttons, and behavior.
- AI builders are powerful, but you still need to test the output like a thoughtful human.
- Small improvements are safer than giant all-at-once changes.
- An MVP is not a perfect product. It is the smallest working version that lets you learn what to build next.

BIG IDEA

You did not “learn to code” today. You learned how to communicate a product idea clearly enough that an AI builder could create a first version.
